

Remittance Advice Gate

AI reads the remittance and posts it. No one retypes anything.

- ◆ An LLM reads the unstructured email or attachment, structures it, and posts to SAP S/4HANA.
- ◆ Clean items post straight through; only genuine exceptions reach the team, with the source advice attached.
- ◆ In production: a live agricultural-sector customer runs it on S/4HANA Private Cloud.

Unstructured emails and attachments

AI reads · structures · matches

SAP S/4HANA

Posted, matched, exceptions surfaced.

THE PROBLEM

Reading remittance advice into SAP, without the retype

Remittance advice still lands as email and PDF that someone keys into SAP cash application by hand. They open the remittance, find the invoices it pays, work out the deductions, and type the match into SAP, one document at a time. Volume is capped by headcount, and month-end is where the backlog shows.

The Remittance Advice Gate reads the unstructured input directly. An LLM extracts the payer, invoices, amounts and deductions, and posts structured data into SAP S/4HANA. Clean items flow through untouched; only genuine exceptions

reach a person, with the source advice attached. The job shifts from retype-everything to review-the-exceptions.

HOW IT WORKS

From unstructured advice to a posted match

An LLM reads the unstructured email or attachment, whether that is an email body, a PDF, a scanned document or a spreadsheet export, and structures it into the fields SAP needs: payer, invoice references, amounts and deductions. It posts to SAP S/4HANA cash application, matching on the way in, so clean items post straight through. A monitor lets the team correct and retrain it as new layouts appear, so coverage improves over time rather than needing a new template each time a bank changes its format.

HOW IT COMPARES

The gate versus the two usual paths

	Remittance Advice Gate	Manual cash application	Rules / template OCR
Reads unstructured email and PDF	AI extraction, no fixed template	A person reads and keys	Works only on known layouts
A new remittance format	Handled, the monitor retrains it	Staff adapt by hand	A new template rule is needed
Output into SAP	Structured, posted to S/4HANA	Hand-keyed	Structured, if the template matched
Effort per remittance	Review exceptions only	Full retype each time	Fix the unmatched ones
Live proof	ChatGPT-powered agricultural customer	Not applicable	Not applicable

Honest comparison. Manual cash application and template-based capture are both real, working approaches; the gate's difference is reading unstructured input directly and learning from corrections, not a claim that the alternatives do nothing.

WHAT IT DELIVERS

STRAIGHT THROUGH

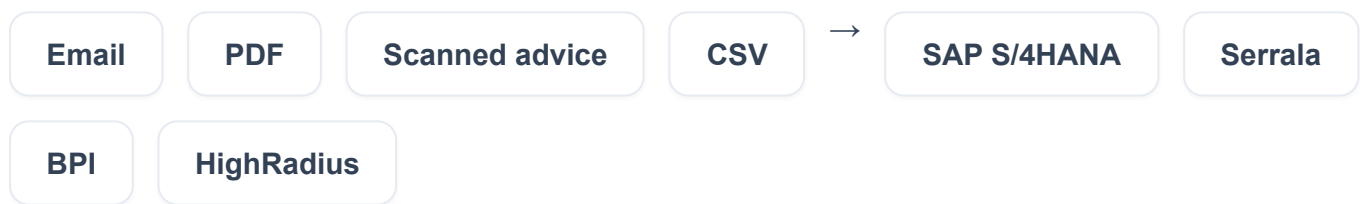

- ◆ Clean items post straight through, untouched by a person.
- ◆ The team reviews exceptions instead of retyping every remittance by hand.

ANY INPUT

- ◆ Reads email bodies, PDF attachments, scanned documents and spreadsheet exports.
- ◆ Extracts payer, invoice references, amounts and deductions, no fixed template.

WORKS WITH

Any remittance format in, SAP cash application out

COMMON QUESTIONS

How do I automate unstructured remittance advice emails into SAP cash application? ✕

Remittance advice arrives as unstructured email and PDF, which staff retype into SAP cash application. An AI-powered remittance gate reads the unstructured input, identifies and structures the data (payer, invoices, amounts, deductions), and delivers it into SAP S/4HANA, with a monitor that trains it over time. The manual retype step is removed.

Can AI read remittance PDFs and post them to SAP S/4HANA? ✕

Yes. A remittance gate uses an LLM to read remittance PDFs, email bodies and attachments, extract the structured fields, and post them into SAP S/4HANA cash application. A live agricultural-sector customer runs this on a ChatGPT-powered deployment on S/4HANA Private Cloud.

How do I reduce manual cash-application matching in SAP? ✕

A remittance gate does the reading and structuring automatically and hands SAP the data already formatted for matching, so the team reviews exceptions instead of retyping every remittance by hand.

What remittance inputs can an AI gate read? ✕

Email bodies, PDF attachments, scanned documents and spreadsheet exports. It reads the unstructured input directly rather than relying on a fixed template, and a monitor lets the team correct and retrain it as new layouts appear.

Does it work with Serrala, BPI or HighRadius? ✕

The gate delivers structured remittance data into SAP S/4HANA, and can also target cash-application platforms such as Serrala, BPI or HighRadius. It sits upstream as the step that turns unstructured remittances into clean, structured input.

IN PRODUCTION

Already in production: a live agricultural-sector customer runs this on a ChatGPT-powered deployment on S/4HANA Private Cloud, with the stated goal of removing the human from the retype entirely.
