

TREASURYCENTRAL, POWERED BY ONEPILOT

Smart Trading

A TreasuryCentral application

Every trade, from the decision to the booked deal in SAP.

One application, in four lines.

What it is

Brisken Smart Trading (BST): every trade, from the decision to the booked deal in SAP. Automated, on your own system, nothing to rebuild.

What it replaces

The manual middle: re-keying tickets, chasing approvals, building deal entries by hand.

What you get

The trade flows from the venue into SAP Treasury on its own, checked and logged.

Who it is for

Teams that trade and book in SAP.

Then the same trade on our clock.

THE PROBLEM

You trade. You book in SAP. Today a person joins the two by hand.

YOUR TRADING VENUES

360T, FXall, Bloomberg, Citi Pulse, BidFX.

THE MANUAL MIDDLE

Re-keying tickets, chasing approvals, building deal entries by hand.

BOOKED IN SAP

Treasury, accounting, analytics.

Manual FX execution: 10 to 15 minutes per trade (The Association of Corporate Treasurers). Spot FX automation across the market is now about 90% (LSEG).

One platform. Every application. Grounded in SAP.

Briskin Smart Trading (BST) runs as an application inside TreasuryCentral, the shipped edition of OnePilot. OnePilot runs in production across chemicals, food & drink, financial-services, oil & gas, agricultural and commodity treasuries.

Autonomous trading, booked in SAP.

Autonomous trading means the trade carries itself from the decision to the booked deal, with no manual re-keying.

THE PROBLEM IT REMOVES

You trade on a venue, then you book in SAP.

Today a person joins the two by hand: re-keying the ticket, chasing the approval, building the deal entry.

WHAT IT DOES, STEP BY STEP

- 1 Reads the exposure (the money at risk from currency or price moves) from your SAP positions.
- 2 Sends the request to the venue; approval runs under your own rules.
- 3 Matches the fill that comes back and shapes it for SAP.
- 4 Books the deal in SAP Treasury, checked and logged.

WHAT YOU NO LONGER DO BY HAND

Re-keying tickets and chasing approvals.

Building deal entries by hand.

Manual FX runs 10 to 15 minutes a trade (The Association of Corporate Treasurers).

CONNECTS TO 360T · FXall · Bloomberg FX GO · Citi Pulse · BidFX → SAP Treasury (TRM/FAM), ECC, S/4HANA · any order management (OMS) or treasury management system (TMS)

The trade, straight through to SAP.

CONNECTS VIA RFC / OData · AMQP · SFTP · REST · HTTP · Email · Excel add-in

The trade flows from the venue into SAP Treasury on its own, checked and logged.

One FX Trade, End to End

FX: foreign exchange, trading one currency for another.

BEFORE · TODAY, BY HAND

A dealer agrees an FX trade on the venue. From that moment the trade is not done until someone books it: re-keying the ticket, chasing the approval, building the deal entry in SAP by hand.

AFTER · SMART TRADING, IN ORDER

- 1 Reads the exposure from your SAP positions.
- 2 Sends the request to the venue: 360T, FXall, Bloomberg FX GO, Citi Pulse or BidFX.
- 3 Runs approval under your own rules.
- 4 Matches the fill that comes back.
- 5 Shapes it for SAP.
- 6 Books the deal in SAP Treasury, checked and logged.

Each step runs on its own or waits for a person; everything is logged.

Derivatives and Securities

A security master: the record a system needs before an instrument can book.

BEFORE · TODAY, BY HAND

A treasury trades more than FX: interest-rate swaps, money-market deposits, bonds and other securities, each with its own booking rules. New instruments stall at master-data setup; a missing security class blocks the booking, and a gap in one record shows up everywhere.

AFTER · SMART TRADING, IN ORDER

- 1 Validates the security class as the trade flows.
- 2 Creates the master record automatically; no manual setup step.
- 3 Enriches the position for analytics and controls.
- 4 Shows the state of every step on one status monitor.

Full audit trail and four-eye sign-off, built in.

OTC Commodity Swaps

OTC: over the counter, a trade agreed directly with a counterparty, not on an exchange.

BEFORE · TODAY, BY HAND

A commodity or energy treasury runs OTC swaps and hedges alongside its physical book. Confirmations arrive from several counterparties in several formats; matching is manual and slow, and a hedge that is not booked on time leaves the exposure open on the books.

AFTER · SMART TRADING, IN ORDER

- 1 Takes each swap from execution through custodian and counterparty confirmation.
- 2 Reads and matches the confirmations automatically.
- 3 Books the hedge into SAP Treasury against the exposure it offsets.
- 4 Works with any venue and any counterparty; nothing to rebuild when you add one.

Four-eye sign-off; the hedge lines up with the position it offsets.

Governed, in plain terms.

The same four controls run under every application, the AI included: it is grounded in SAP, not free-floating, and keeps a human in the loop on the moves that matter. What each control means, and why it matters:

Audit trail

Every action is logged and can be reviewed later, end to end. Nothing happens off the record.

Four-eyes / segregation of duty

The person who enters something is not the one who approves it. A human stays in the loop (HITL) on the moves that matter.

Anomaly alerts

The system flags what looks wrong before it posts, not after, so a bad value is caught on the way in.

Manage by exception

People only touch the cases that need judgment. The rest just runs, and you hear about the odd one out.

AI grounded in SAP, with a human in the loop. · Certified to ISO 27001 and SOC 1 Type II.

CONTACT

Let's book your first trade, hands off.

We build the autonomous treasury one use case at a time, on the platform you already run.
