

Market Data Hub for Commodities

A commodities case study, in technology and concepts, from many sources to one governed price.

Your sources

Market Data Hub

Risk and trading

Every commodity price has a dozen moving parts.
Someone builds the curve by hand.

The Market Data Hub is the middle, so one governed curve reaches every desk on its own.

One governed hub, from source to system.

Commodity price curves.

A curve on a timeline

Today's spot price, then 30, 60 and 90 days, out to a year.

Composite by design

Transportation, storage, quality and local taxes, combined into one price per tenor.

Location matters

The same commodity differs by delivery point, as storage, port fees and the local market differ.

Many sources, one governed process.

Every change is versioned, approved, and audited, end to end.

One curve, feeding risk and trading.

The data and AI layer for SAP treasury and trading.

Built on SAP

An SAP co-innovation partner. The hub runs on SAP's own cloud, so it sits inside your landscape, not beside it.

Provider and target agnostic

Pull from any market data feed, push to any system, SAP or not, and change your sources at any time.

Governed end to end

Every rate is validated on the way in and every change is audited, before anything reaches a downstream system.

Co-innovation partner

SAP Certified, built on SAP's own cloud

ISO 27001 and SOC 1 Type II

The data, the platform, and the teams behind it.

TECHNOLOGY PARTNER

TRUSTED BY TEAMS AT

MARKET DATA PROVIDERS

Built to stay done.

Give us twenty minutes on your commodity price data, and we will show you one governed curve feeding every desk.
