

TreasuryCentral

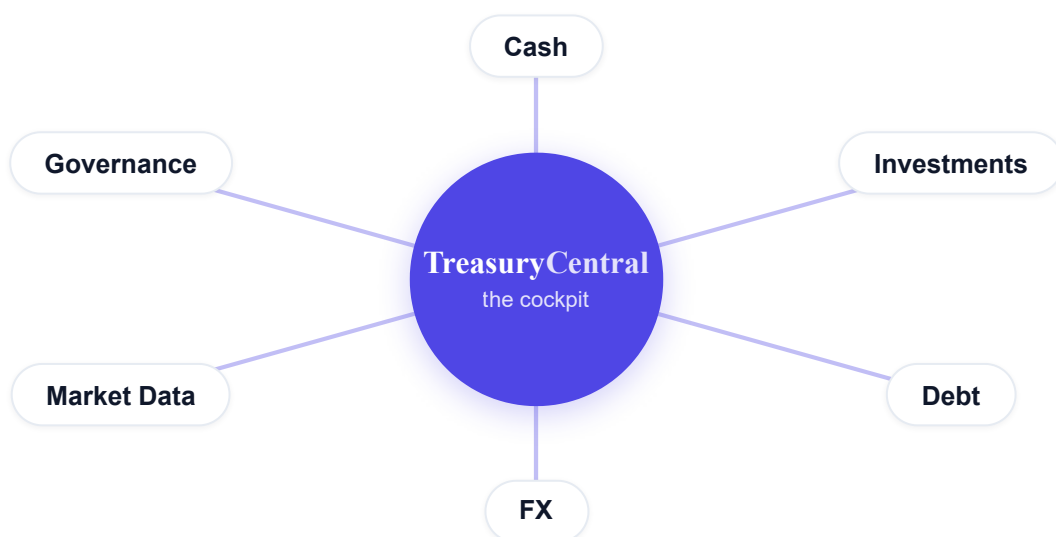

Cash, investments, debt, FX and market data in one screen, on your SAP data.

- ◆ One view of the money: cash, investments and debt across entities, reconciled to SAP.
- ◆ FX and market data validated before they reach a decision.
- ◆ Audit trail, manage-by-exception, four-eye and segregation of duties on every record.

ONE COCKPIT · SIX DOMAINS

THE PROBLEM

The treasurer's day on one surface

Most SAP finance teams run several brittle, hand-built feeds to move market data, trades, bank files and remittances in and out of SAP. They break when a field changes or the person who built them leaves: no audit trail, no owner, no monitoring. Between them, the treasurer's day goes to moving data between screens instead of using it.

TreasuryCentral is OnePilot scoped to the treasurer: cash, investments, debt, FX, market data and governance on one screen, on your SAP data. The cockpit is what you see; OnePilot is the layer that moves the data in and out of SAP, governed end to end. It takes the brittle feeds off your team, and the treasurer stays in command.

WHAT YOU GET

ONE VIEW OF THE MONEY

Cash, investments and debt

Cash positions roll up from every bank account and entity, reconciled to the statements already in SAP, so the group number is current instead of a Monday spreadsheet pull. Investments, debt and intercompany loans sit on the same screen with their maturities and interest, and every figure links back to the SAP record it came from.

FX AND MARKET DATA, GOVERNED

Numbers you can trace

Spot and forward rates, yield curves and prices arrive from Bloomberg, Refinitiv, 360T and central-bank feeds, normalized once and checked for gaps and outliers before anything posts. FX exposure by currency and entity updates as positions move, with the source and the validation recorded against each value, so a hedge decision rests on numbers you can trace.

CONTROL BUILT IN

Governed by design

Every value carries where it came from, who approved it and when, so an audit follows the trail without a reconstruction project. Limits and tolerances are set once; only the records that breach them surface for a person, and a second approver signs off before a payment or a deal is released.

WHAT IT TAKES OFF YOUR TEAM

The brittle feeds it replaces

The apps that run underneath TreasuryCentral each take one hand-built feed off your team, governed end to end, so the cockpit shows a number you can act on rather than one you have to assemble.

- ◆ Market data: rates, curves and prices from every provider, governed into SAP.
- ◆ Trades: captured at the venue and booked in SAP TRM, straight through.
- ◆ Bank files: fee statements in any format, matched against the agreement.
- ◆ Remittances: unstructured advice read by AI and posted to S/4HANA.

COMMON QUESTIONS

What is TreasuryCentral? ✕

TreasuryCentral is the treasury edition of OnePilot. It puts the treasurer's whole day on one surface: cash, FX, market data, trades, bank files and remittances, governed end to end, on your SAP data.

What runs underneath TreasuryCentral? ✕

The treasury apps run on OnePilot, the governed AI layer that moves data in and out of SAP. TreasuryCentral is OnePilot scoped to the treasurer, so market data, trades, bank files and remittances all flow through one governed layer, on your SAP data.

Does it need a separate data store? ✕

No. It works on the SAP data you already trust, so there is no separate store to reconcile. Every move is logged, and every action stays inside your controls.
