

TREASURYCENTRAL, POWERED BY ONEPILOT

Market Data Hub

for Commodities

One governed price curve for every commodity you trade.

One application, in four lines.

What it is

One governed price curve for every commodity you trade, assembled from every component that moves it.

What it replaces

Curves built by hand, differing desk to desk.

What you get

Risk and trading priced off the same governed curve, with a full audit trail.

Who it is for

Treasury and trading teams on SAP with commodity exposure.

The pages ahead follow one price from the ground to the desk.

THE PROBLEM

Every commodity price has a dozen moving parts.
Someone builds the curve by hand.

COMPONENTS AND SOURCES

Freight, storage, quality, local taxes, provider feeds.

THE MANUAL MIDDLE

Collecting components, adjusting by port and time horizon, reconciling by hand.

RISK AND TRADING

Prices that differ desk to desk.

WHERE IT SITS

One platform. Every application. Grounded in SAP.

Market Data Hub for Commodities runs as an application inside TreasuryCentral, the shipped edition of OnePilot. OnePilot runs in production across commodity, oil & gas, chemicals, food & drink, financial-services and agricultural treasuries.

One price, followed from the ground to the desk.

A commodity price is composite: the underlying quote plus freight, storage, quality adjustments and local taxes, combined per tenor (how far out on the timeline) and per delivery point.

THE PROBLEM IT REMOVES

The same commodity prices differently by delivery point, as freight, storage, port fees and the local market all differ.

Today the curve is built by hand in spreadsheets, so prices differ desk to desk and no one can show how a number was reached.

WHAT IT DOES, STEP BY STEP

- 1 Collects feeds, exchange quotes, freight and storage rates.
- 2 Combines them into one price per tenor, per delivery point.
- 3 Builds the curve from today out to a year.
- 4 Feeds it to risk, the trading desk and SAP Treasury.

WHAT YOU NO LONGER DO BY HAND

Building the curve by hand in spreadsheets.

Reconciling prices that differ desk to desk, and showing how a number was reached.

Assembling the audit trail by hand.

CONNECTS TO provider feeds · exchange quotes · freight & storage rates · internal spreadsheets → risk management, trading desk, SAP Treasury, any downstream system

The curve, from components to the desk.

CONNECTS VIA RFC / OData · AMQP · SFTP · REST · HTTP · Email · Excel add-in

Every input validated on the way in; every change versioned and audited.

Commodity Price Curves

Building the curve: today's spot (the price for delivery now), then 30, 60 and 90-day tenors, out to a year.

BEFORE · TODAY, BY HAND

Follow one price today: the underlying quote is only the start. Freight, storage, quality and local taxes all move it, and someone combines them in a spreadsheet, per delivery point, per tenor.

AFTER · THE MARKET DATA HUB, IN ORDER

- 1 Starts with today's spot and builds the curve along the timeline: 30, 60 and 90 days, out to a year.
- 2 Combines the underlying quote with freight, storage, quality adjustments and local taxes.
- 3 Prices per tenor, per delivery point.
- 4 Validates every input on the way in and flags anomalies.

Anomalies wait for a person's approval; every change is versioned and audited.

Valuation and Exposure Prices

Mark-to-market: valuing today's positions at today's market price. Exposure: the money at risk from price moves.

BEFORE · TODAY, BY HAND

Valuation runs off prices pulled by hand from several venues; a late or wrong price moves the day's P&L (profit and loss). Risk, trading and accounting each source their own price, so the numbers disagree.

AFTER · THE MARKET DATA HUB, IN ORDER

- 1 Collects end-of-day and settlement prices from the exchanges and providers, on schedule.
- 2 Governs them: validated on the way in, versioned and audited.
- 3 Feeds SAP position valuation and exposure management, tied to the positions they value.
- 4 Gives risk, trading and accounting the same governed number.

A person reviews the flagged prices; the numbers agree.

Governed, in plain terms.

The same four controls run under every application, the AI included: it is grounded in SAP, not free-floating, and keeps a human in the loop on the moves that matter. What each control means, and why it matters:

Audit trail

Every action is logged and can be reviewed later, end to end. Nothing happens off the record.

Four-eyes / segregation of duty

The person who enters something is not the one who approves it. A human stays in the loop (HITL) on the moves that matter.

Anomaly alerts

The system flags what looks wrong before it posts, not after, so a bad value is caught on the way in.

Manage by exception

People only touch the cases that need judgment. The rest just runs, and you hear about the odd one out.

AI grounded in SAP, with a human in the loop. · Certified to ISO 27001 and SOC 1 Type II.

CONTACT

Let's price your first curve.

We build the autonomous treasury one use case at a time, on the platform you already run.
