

THE PLATFORM

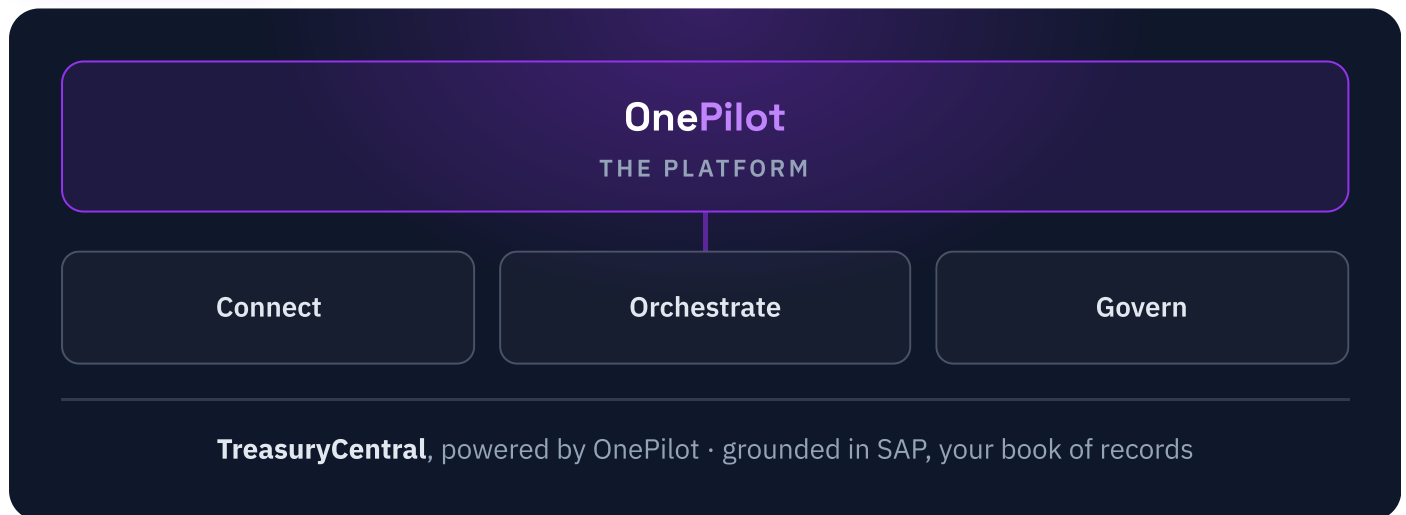

OnePilot

The platform underneath everything: Connect, Orchestrate, Govern.

- ◆ One platform for everything between your systems and SAP. Not limited to treasury.
- ◆ TreasuryCentral, powered by OnePilot, is its one shipped edition and Brisken's main product.
- ◆ The Digital Co-Worker, a feature of OnePilot, runs each task with full context; people stay in charge.
- ◆ The book of record stays in SAP; OnePilot orchestrates on top, SAP and non-SAP, both ways.

THE PROBLEM

Why a treasurer's day becomes tab management

A treasurer's day becomes tab management: the trading platform in one window, market data in another, bank portals and cash tools in others, and the numbers re-keyed between them. The day goes to moving data instead of using it. Around SAP, that shows up as shadow integrations, hand-keyed files and home-built scripts that move data in, fragile and unowned, plus a backlog of interfaces to build and maintain.

OnePilot puts the data in one governed place, so the day shifts back to using it: deciding, not re-typing. It is a no-code platform over your SAP landscape where your team and its Digital Co-Workers do the repetitive work, ingesting, validating, posting and reconciling, always inside your controls. The book of record stays in SAP; OnePilot orchestrates on top.

THE MARKET

The shadow integration is the default state, not the exception

71%

of US SAP-treasury roles describe building or hand-running integrations into SAP, or manual data work (29 of 41).

34%

are tied to an active S/4HANA migration or SAP implementation, the moment feeds get re-plumbed (14 of 41).

22%

name a specific market-data or trading vendor whose feed has to reach SAP, and that is a floor (9 of 41).

Source: Brisken Shadow Integration Report, N=41 US SAP-treasury job ads, read 2026-06-17. These are market-research figures, not an OnePilot performance metric.

THE PLATFORM

Connect, Orchestrate, Govern

The Digital Co-Worker learns your systems and recommends each mapping; you approve it, and the task runs governed end to end, SAP and non-SAP, both ways. Configured, not coded, so a new feed goes live in weeks rather than a multi-quarter build your team then owns.

1

Connect

Every system, in and out: banks, market data, ERP, portals.

2

Orchestrate

The Digital Co-Worker runs each task with full context, at scale.

3

Govern

Audit, segregation of duties, anomaly alerts, person-in-the-loop.

THE DIGITAL CO-WORKER

A FEATURE OF ONEPILOT

The agent inside a space

The Digital Co-Worker drives the solution, watches every run, fixes what breaks, and brings you the decisions. It is a feature of OnePilot, never a product of its own, and never sold standalone.

AN AGENTIC TEAM

Roles, not one bot

Specialised agents with roles: Domain Specialists, Analysts, Clerks and Personal Assistants, each briefed for its part of the work.

THE SPACES

Run it together

Every app and use case has a space where your team and its Digital Co-Workers run it together: chat, alerts, fixes, orchestration. A colleague, not a black box.

GOVERNANCE

Six controls on every record

Governed to EU AI Act principles, on a 360° audit trail, certified to ISO 27001 and SOC 1 Type II. A person approves the moves that matter.

Bounded autonomy

Acts only within the permissions and limits you set.

Human authority

A person owns the moves that matter, and can review, override or stop.

Four-eyes, segregation of duties

Whatever initiates a step never approves it.

Robust and fail-safe

Tested before it runs, behaves predictably, safe-stops or rolls back on error.

Traceable and explainable

Every action and data change logged: who, what, when, why, and explainable.

Monitored, managed by exception

Outputs watched in real time; anomalies go to a person, the rest just runs.

HOW IT CONNECTS

Connects to what you already run

RFC & OData

SFTP

SOAP & REST

AMQP

Email

Excel add-in

XLSX / CSV / TXT

Web scraping

LLM & browser automation

Push and pull, off-the-shelf, third-party-managed and low-maintenance. Sources on one side (Bloomberg, LSEG, 360T, OANDA, central banks, banks, files and email) and SAP on the other (S/4HANA, TRM, Cash and Credit Management), with non-SAP systems in the same governed perimeter. A new feed is set up on a managed product, so it goes live in weeks rather than a multi-quarter integration project your team has to build and then own.

THE MODULES

Two applications, seven use cases, and the ones you build

Module	Type	Status	Problem it removes
Market Data Hub	APP	LIVE	Rates and prices arrive from a dozen places; nobody owns the number.
Brisken Smart Trading	APP	LIVE	A trade is re-keyed between venue and SAP; best execution unprovable.
Intercompany Funding Request	UC	LIVE	Funding between entities runs on emails and hand-keyed bookings.
Remittance Advice Gate	UC	LIVE	Payments land, but which invoices do they clear? Cash application by eye.
Cash Flow & Exposure Hub	UC	LIVE	Exposure data sits scattered across entities; the hedge is always late.
Bank Fee Portal	UC	POC	Bank charges get paid unchecked against what was actually agreed.
Bank Statement Generator	UC	LIVE	Statements are hand-built to each bank's format, every single day.
Credit Data Hub	UC	LIVE	Counterparty risk is spread across agencies and never quite current.
ESG Data Hub	UC	POC	ESG metrics are fragmented across providers when reporting falls due.

Two applications, built once and maintained by Brisken; the rest are use cases, assembled from the same kit and owned by you. Your problem isn't on the list? That's the next one.

IN PRODUCTION

FINANCIAL SERVICES

S/4HANA Public Cloud

A financial-services group already governs several data domains from one OnePilot deployment.

AGRICULTURAL

S/4HANA Private Cloud

Runs the Remittance Advice Gate: the enriched advice is handed to the clearing engine, and a person owns the exceptions.

CHEMICALS

S/4HANA On-Prem

An intercompany funding-request process across a complex SAP integration, governed; a person approves the moves that matter.

COMMON QUESTIONS

Does OnePilot replace SAP?

No. OnePilot orchestrates on top of SAP. The book of record stays in SAP, execution on the trading platform, and market data through the hub. It composes the apps and data your work needs on one surface, without moving the system of record.

Can we deploy a Digital Co-Worker in treasury without consuming our IT budget?

Yes. OnePilot is configured, not coded, and runs as a managed product on top of your SAP landscape, so there is no ABAP build and nothing new for your IT team to own or maintain. A new feed or Digital Co-Worker is set up on the product and goes live in weeks, which keeps the work off the IT backlog and the cost off the development budget.

Is AI automation in treasury safe?

It is safe when the AI runs inside your controls rather than around them. Each OnePilot process works to rules you set and approve, with four-eye release, segregation of duties and a full audit trail on every record. You keep command of policy and exceptions; the Digital Co-Worker handles the repetitive steps, and nothing moves outside the rules you define.

Can AI improve liquidity forecasting?

Yes. A forecast is only as good as the data feeding it, and most of the delay is in collecting and cleaning cash, bank and exposure data by hand. OnePilot keeps that data current and governed in SAP, so the forecast runs on a clean, reconciled base. Treasury still owns the assumptions and the call; the Digital Co-Worker removes the manual data work that slows the forecast down.

Can AI help the team focus the day on what matters?

Yes. The repetitive work, ingesting feeds, validating, posting and reconciling, runs underneath by exception, so the team sees what needs a decision instead of working through every record. Their day shifts from re-keying and chasing data to judgment, review and the exceptions that actually need a person.

PROOF

OnePilot is delivered by an SAP Co-Innovation Partner and PartnerEdge member, part of SAP Industry Cloud for Financial Services and Commodities, certified to ISO 27001 and SOC 1 Type II. It runs on SAP's own cloud, inside your landscape; your book of records stays in SAP. TreasuryCentral, powered by OnePilot, is its one shipped edition. The Market Data Hub and Briskin Smart Trading are listed on the SAP Store.
