

REMITTANCE PROCESSING

Remittance Advice Gate

A gate in front of your clearing engine. It makes sure what reaches the engine is worth clearing.

- ◆ A remittance advice is the note a payer sends listing which invoices a payment covers. The Gate turns it into data your clearing system can actually use.
- ◆ It sits in front of your clearing engine, not instead of it. We do not match and we do not clear.
- ◆ Deterministic where the format is known; the Digital Co-Worker reads what no rule anticipated and shows the evidence.
- ◆ A correction made once becomes memory and context; the provider's model is never trained on your data.

Scanned advice

Unstructured emails and attachments

reads • structures • enriches

Your clearing engine

Enriched and checked. The Gate never matches and never clears.

THE BOUNDARY

We do not match and we do not clear

It enriches the advice; it never matches an item and never clears one.

The Gate sits in front of your clearing engine, not instead of it. We make sure what reaches the engine is worth clearing, then hand over to SAP S/4HANA or your cash-application processor, whether that is Serrala, HighRadius or another. Cash application by eye is the problem; the Gate removes the retype in front of it, not the engine behind it.

HOW IT WORKS

Determinism where it works, intelligence where it doesn't

Rules handle the formats a rule can anticipate. For everything else, the Digital Co-Worker reads what no rule anticipated, any layout, scans, screenshots, infers the reference, shows the evidence, explains short-pays and learns the payer.

1

Parse

Deterministic where the format is known: EDI 820, IDoc, camt.054, XML, CSV, fixed-width.

2

Normalise

Every layout mapped into one shape, whatever shape it arrived in.

3

Clean and check

Amounts footed, references resolved, short-pays and deductions read out.

4

Hand over

The result goes to your clearing engine, worth clearing, with the evidence attached.

THREE DOORS OUT

Every advice leaves by one of three doors

DOOR 1

Ready to process

Clean and complete, straight to your clearing engine, no one touches it.

DOOR 2

Enriched, with a confidence label

The Co-Worker filled the gaps, and hands over the evidence and a confidence label alongside the data.

DOOR 3

On a person's list

Below the confidence threshold or above your value limit, with the proposed answer and the reasoning, for a person to decide.

WHY A PERSON STILL DOES IT BY HAND

Sixteen ways an advice arrives unusable, and every one is a person filling in the blanks by hand

- ◆ No reference
- ◆ Wrong reference
- ◆ Buried in narrative
- ◆ Locale and language
- ◆ Unreadable by design
- ◆ Split across pages
- ◆ Duplicates
- ◆ Multi-invoice
- ◆ One advice, many payments
- ◆ Out of sequence
- ◆ Partial payment
- ◆ Deductions and short-pay
- ◆ Credit notes and rebates
- ◆ Amounts that don't foot
- ◆ Currency missing
- ◆ Group and third-party payers

Your team and its Digital Co-Workers run the Gate together.

The remittance space is where people and the Digital Co-Worker work the advices side by side: the Co-Worker reads, infers and explains; a person decides the ones that carry judgment. The Digital Co-Worker is a feature of OnePilot, not a separate product.

HOW IT COMPARES

The gate versus the two usual paths

	Remittance Advice Gate	Manual cash application	Rules / template OCR
Reads unstructured email and PDF	The Co-Worker reads it, no fixed template	A person reads and keys	Works only on known layouts
A new remittance format	Handled, the Co-Worker reads it and learns the payer	Staff adapt by hand	A new template rule is needed
Output	Enriched and handed to your clearing engine	Hand-keyed	Structured, if the template matched
Matching and clearing	Left to your engine, never done here	A person does it by eye	A person does it by eye
Effort per advice	Review the exceptions only	Full retype each time	Fix the unmatched ones

Honest comparison. Manual cash application and template-based capture are both real, working approaches; the Gate's difference is reading unstructured input directly and learning the payer, not a claim that the alternatives do nothing.

WORKS WITH

Any remittance format in, your clearing engine out

EmailPDFScanned adviceEDI 820camt.054

SAP S/4HANA Serrala HighRadius

LEARNING

A correction becomes memory, not training data

A correction made once becomes memory and context, so the next advice of the same shape arrives worked out rather than re-solved. The provider's model is never trained on your data. Coverage improves through experience, not by retraining a model on what you sent.

COMMON QUESTIONS

How do I turn unstructured remittance advice emails into data my clearing engine can use?

Remittance advice arrives as unstructured email and PDF, which staff retype before anything can clear. The Gate reads the unstructured input, structures it (payer, invoices, amounts, deductions), enriches it and hands it to your clearing engine worth clearing. It sits in front of the engine; it does not match and does not clear.

Does the Gate post into SAP and clear the items itself?

No. The Gate enriches the advice and hands over to SAP S/4HANA or your cash-application processor. Matching and clearing stay in your engine. The Gate makes sure what reaches the engine is worth clearing; it never matches an item and never clears one.

Can it read remittance PDFs and scans, or only structured files?

Yes. Where the format is known it parses deterministically (EDI 820, IDoc, camt.054, XML, CSV, fixed-width). For everything else the Digital Co-Worker reads any layout, including scans and screenshots, infers the reference and shows the evidence.

What happens when a new remittance format shows up?

The Digital Co-Worker reads it and learns the payer, so the next one arrives worked out. A correction made once becomes memory and context; the provider's model is never trained on your data, and no new template rule is needed.

Does it work with Serrala or HighRadius?

Yes. The Gate hands the enriched, checked advice to SAP S/4HANA or to a cash-application processor such as Serrala or HighRadius. It sits upstream as the step that turns unstructured remittances into input worth clearing.

IN PRODUCTION

Already in production: a live agricultural-sector customer runs the Gate on S/4HANA Private Cloud. The Gate enriches the advice and hands it over; a person still owns the exceptions.
