

MARKET DATA

Market Data Hub

One source for every rate you rely on.

- ◆ Market data means the FX and interest rates, commodity prices and credit ratings a treasury runs on. Today they arrive from a dozen places.
- ◆ Any source in, any consumer out: Bloomberg, LSEG, 360T, OANDA, CME, central banks, government, websites and internal feeds.
- ◆ Validated, cleansed and calculated on arrival, then distributed to SAP and non-SAP, both directions, 100% no-code.
- ◆ An application on OnePilot; inside TreasuryCentral it runs as your team's market-data source.

EVERY PROVIDER · ONE FEED

Bloomberg **LSEG** Ice **CME Group****one governed feed****SAP****non-SAP**

Both directions, no code. Central banks included.

Rates and prices, from a dozen places to one owned number

SILOED DATA

One source of truth

Rates and prices arrive from a dozen places and nobody owns the number. The hub centralizes them into consistent numbers, at lower data cost.

POOR DATA QUALITY

Governed end to end

Every source is validated, cleansed and calculated on arrival, transparent from source to delivery, on a 360° audit trail.

INFLEXIBLE TOOLING

Configurable and agnostic

Any source, any target, any data class, changed any time, 100% no-code.

THE MARKET

Loading market data by hand is the default, not the exception

71%

of US SAP-treasury roles describe building or hand-running integrations into SAP, or manual data work (29 of 41).

34%

are tied to an active S/4HANA migration or SAP implementation, the moment feeds get re-plumbed (14 of 41).

22%

name a specific market-data or trading vendor whose feed has to reach SAP, and that is a floor (9 of 41).

Source: Brisken Shadow Integration Report, N=41 US SAP-treasury job ads, read 2026-06-17. These are market-research figures, not a Market Data Hub performance metric.

HOW IT WORKS

Any source in, any consumer out

The hub sits between every provider and every system that needs a rate. Integrate once, govern and transform in one place, calculate what you need, and store the curated number every consumer reads.

1

Integrate

Push and pull, any protocol, any format, no coding.

2

Govern

Validation, anomaly checks, quality and cleansing, with schedulers and the audit trail attached.

3

Transform

Cleanse, normalize, map and date-shift each source into one shape.

4

Calculate

Invert, triangulate and interpolate, plus your own formulas and libraries.

5

Store

The curated market-data store, high performance and available. Any source in, any consumer out.

THE MARKET-DATA SPACE

One new advantage: the market-data space

Your team and its Digital Co-Workers run the hub together.

The market-data space is where people and the Digital Co-Worker run the hub side by side. The Co-Worker configures, monitors and operates the feeds; people stay in charge. The Digital Co-Worker is a feature of OnePilot, not a separate product.

WHY IT WINS

SOURCE AND PROVIDER AGNOSTIC

Any provider

Bloomberg, LSEG, 360T, OANDA, CME, central banks, government, websites and internal feeds, all through one governed feed.

GOVERNANCE WITHOUT LIMITS

Validated and calculated

Validation, anomaly detection, quality and cleansing, schedulers, plus calculations: inversion, triangulation, interpolation, date shifts, averages and your own formula libraries.

OPEN DATA MODELS

Any data class

Credit risk, security master, ESG, climate and social; any data class the treasury needs, beyond rates alone.

TARGET SYSTEM AGNOSTIC

SAP and non-SAP

Push or pull over API, OData, SFTP, files or e-mail; out of the box for SAP ECC and S/4HANA, no coding.

HOW IT COMPARES

The hub versus the two usual paths

	Market Data Hub	SAP-native Datafeed	Custom script
Setup	No-code configuration	ABAP function lists and translation tables	Bespoke code per provider
Add or swap a source	Configuration change	New function list and mapping	New script
Multiple sources	One normalized pipe, many sources	Configured per provider	One interface per provider
Governance	Audit trail, segregation of duties, exception alerts built in	Manual or custom	None unless coded
Who maintains it	Managed product on your SAP landscape	In-house ABAP	Whoever wrote it
When a source changes a field	Absorbed in configuration	ABAP edit needed	The script breaks
SAP-listed	Yes, on the SAP Store	Native to SAP	Not applicable

Honest comparison. The SAP-native Datafeed is a real, supported path; the point of a hub is the no-code, multi-source, governed layer over it, not a claim that SAP cannot do this.

WHAT IT RETIRES

What it retires

- ✗ Per-provider upload scripts, maintained by hand and understood by one person
- ✗ Rates re-keyed into spreadsheets before they ever reach SAP
- ✗ Point-to-point integrations that break when a feed changes a field
- ✗ ABAP upkeep for every new or changed source

WORKS WITH

Every source in, SAP and non-SAP out

Beyond the logos above, the hub also handles 360T, OANDA, central banks, government agencies, public websites and internal feeds. Switching or adding a source is a configuration change, not a new interface, so there is no per-source rebuild to maintain.

How do I get Bloomberg market data into SAP TRM automatically?

The SAP-native path is a Datafeed RFC connection with per-provider function lists and translation tables, or a per-security custom interface, both of which need ABAP upkeep and break when Bloomberg changes a field. A governed market-data hub ingests Bloomberg once, normalizes it, and distributes into SAP TRM with an audit trail and exception alerts, no code.

How do I load LSEG rates and curves into SAP S/4HANA treasury?

LSEG rates and curves reach SAP S/4HANA treasury through the same governed hub that handles any source: integrate the feed once, transform it, distribute into Market Rates Management. Switching or adding a source is a configuration change, not a new interface, so there is no per-source rebuild to maintain.

Can I automate FX rates and yield curves into SAP Market Rates Management without ABAP?

Yes. SAP's native route uses a Datafeed RFC with function lists and translation tables, which needs ABAP to set up and maintain. A no-code market-data hub maps and schedules FX rates and yield curves into SAP Market Rates Management through configuration, so the treasury team owns the feed without writing or changing ABAP.

What is the alternative to a custom Bloomberg-to-SAP script that keeps breaking?

A custom script breaks whenever the source changes a field or the person who wrote it leaves. A managed market-data hub replaces it with a configured, monitored interface: source changes are absorbed in configuration, the feed is governed with an audit trail and exception alerts, and nobody is babysitting a brittle script.

How do I feed OANDA or central-bank rates into SAP cash management?

OANDA and central-bank rates feed into SAP cash management through the same hub as every other source. Multiple sources land in one normalized pipeline rather than separate point interfaces, so the rates that drive cash and liquidity views come from one governed feed with a single point of control.

How do I govern multiple market-data sources into SAP from one place?

A market-data hub is the single point of control for every source feeding SAP: Bloomberg, LSEG, OANDA, 360T, central banks. It validates, normalizes and distributes each feed, with an audit trail, segregation of duties, and manage-by-exception alerts. Governance is built into the feed, not bolted on per interface afterwards.

What is the best way to handle market-data integration during an S/4HANA migration?

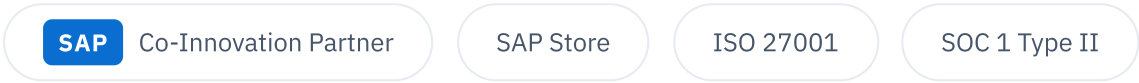

A migration forces every treasury data feed to be re-plumbed, which is when hand-built market-data interfaces are most expensive to rebuild. Moving the feeds onto a governed hub during the migration re-platforms them once onto a managed interface instead of re-coding each script. In a read of US SAP-treasury job ads, 34% sat inside an active migration.

Is there a no-code alternative to SAP TRM datafeed configuration?

The SAP TRM Datafeed needs ABAP-side setup of function lists and translation tables per provider. The alternative is a no-code hub that handles integrate, transform and distribute through configuration, aimed at treasury teams that do not have the ABAP capacity to build and maintain the datafeed themselves.

WHERE THE TRUTH LIVES

Market Data Hub is a live application on the OnePilot platform, listed on the SAP Store. Brisken is an SAP Co-Innovation Partner, certified to ISO 27001 and SOC 1 Type II. OnePilot runs on SAP's own cloud, inside your landscape; your book of records stays in SAP. The market-data truth lives in the hub; SAP, your book of records, is one of its many consumers.
