

TREASURYCENTRAL, POWERED BY ONEPILOT

Market Data Hub

A TreasuryCentral application

Every rate you rely on, curated once, governed end to end.

One application, in four lines.

What it is

Every rate and reference you rely on, from any source to every system. Curated once, governed end to end.

What it replaces

Rates lined up by hand from a dozen places; re-keying, fixing formats, chasing bad values.

What you get

One governed layer for SAP Treasury, with a full audit trail on every change.

Who it is for

Treasury teams on SAP. The hub sits inside your landscape, not beside it.

The next page is where you are today.

THE PROBLEM

Your rates live in a dozen places. Someone lines them up by hand.

YOUR SOURCES

Bloomberg, Refinitiv, 360T, OANDA, central banks, websites, anywhere.

THE MANUAL MIDDLE

Re-keying rates, fixing formats, chasing bad values, reconciling by hand, fearing month-end.

YOUR SYSTEMS

SAP, analytics, non-SAP apps, everywhere.

Sound familiar? Late nights stitching rates together, a month-end everyone dreads, and reports that never stay final.

WHERE IT SITS

One platform. Every application. Grounded in SAP.

Market Data Hub runs as an application inside TreasuryCentral, the shipped edition of OnePilot. OnePilot runs in production across financial services, chemicals, food & drink, oil & gas, commodity and agricultural treasuries.

One source for every rate you rely on.

Market data means the FX and interest rates, commodity prices and credit ratings a treasury runs on. Today they arrive from a dozen places.

THE PROBLEM IT REMOVES

Your rates live in a dozen places, lined up by hand.

Re-keying, fixing formats, chasing bad values, reconciling before month-end.

WHAT IT DOES, STEP BY STEP

- 1 Pulls every rate from any source: Bloomberg, Refinitiv, 360T, OANDA, central banks.
- 2 Checks each value on arrival for anomalies, completeness and accuracy.
- 3 Calculates and shapes it: inversions, triangulation, your own formulas.
- 4 Pushes it into SAP and non-SAP systems, on schedule or on demand.

WHAT YOU NO LONGER DO BY HAND

Re-keying rates and fixing formats.

Chasing bad values and reconciling by hand.

Assembling the audit trail by hand.

The month-end everyone dreads.

CONNECTS TO Bloomberg · Refinitiv · 360T · OANDA · central banks → SAP ECC & S/4HANA, non-SAP systems · via API, OData, SFTP, email, Excel add-in

Market data, into your SAP context.

FX & Interest Rates into SAP

FX: foreign exchange, the currency rates a treasury deals and values with.

BEFORE · TODAY, BY HAND

The rates SAP needs each day come from market data providers, central banks, government agencies, even websites. Today someone pulls each one, fixes the format, and lines them up by hand.

AFTER · THE MARKET DATA HUB, IN ORDER

- 1 Pulls rates from any provider or feed, with nothing to swap out.
- 2 Calculates what you need: date shifts, inversion, triangulation, interpolation, averages, your own formula libraries.
- 3 Shapes each value exactly how the target system needs it.
- 4 Pushes the curated data into SAP ECC and S/4HANA, or any non-SAP system, on a schedule or on demand.

Each step runs on its own or with a person in the loop; everything is logged.

Anomaly Catch and Governance

Anomaly detection: catching a value that looks wrong before it reaches a system.

BEFORE · TODAY, BY HAND

A bad rate is usually caught late, after it has already moved into reports. Someone reconciles by hand to find where it came from, and the report never stays final.

AFTER · THE MARKET DATA HUB, IN ORDER

- 1 Checks every value as it arrives: anomaly detection, completeness, accuracy, timeliness.
- 2 Catches odd or bad data before it moves anywhere.
- 3 Requires a second person on the changes that matter (segregation of duty).
- 4 Records every value and every change end to end, and alerts on exceptions.

You hear about the odd one out; the rest just runs.

Commodity Price Curves

A price curve: today's spot (the price for delivery now), then 30, 60 and 90 days, out to a year. Covered in depth in the Market Data Hub for Commodities deck.

BEFORE · TODAY, BY HAND

The same commodity differs by delivery point, as storage, port fees and the local market differ. Today the curve is built by hand, and prices differ desk to desk.

AFTER · THE MARKET DATA HUB, IN ORDER

- 1 Builds the curve on a timeline: spot, then 30, 60 and 90-day tenors, out to a year.
- 2 Combines transportation, storage, quality and local taxes into one price per tenor.
- 3 Prices each curve per delivery point.
- 4 Validates every price on the way in; every change versioned and audited.

Anomalies wait for a person's approval.

Credit and Counterparty Data

A credit rating: an agency's score of how likely a counterparty is to pay.

BEFORE · TODAY, BY HAND

A treasury tracks ratings and limits for its banks, customers and counterparties, pulled from several agencies. Some deliver by API, others only a PDF report; someone re-keys them by hand, and a stale rating means a limit decision on old data.

AFTER · THE MARKET DATA HUB, IN ORDER

- 1 Collects credit data from any agency or source, by API or from a PDF.
- 2 Reads the report and extracts the rating and credit report attributes into structured data.
- 3 Feeds SAP Credit Management and business partner, or any risk system.
- 4 Alerts when a rating changes.

A person owns the limit decision; the data is current.

Governed, in plain terms.

The same four controls run under every application, the AI included: it is grounded in SAP, not free-floating, and keeps a human in the loop on the moves that matter. What each control means, and why it matters:

Audit trail

Every action is logged and can be reviewed later, end to end. Nothing happens off the record.

Four-eyes / segregation of duty

The person who enters something is not the one who approves it. A human stays in the loop (HITL) on the moves that matter.

Anomaly alerts

The system flags what looks wrong before it posts, not after, so a bad value is caught on the way in.

Manage by exception

People only touch the cases that need judgment. The rest just runs, and you hear about the odd one out.

AI grounded in SAP, with a human in the loop. · Certified to ISO 27001 and SOC 1 Type II.

SUCCESS STORIES

Live deployment, real industry.

A production deployment in financial services, replacing a manual way of working.

FINANCIAL SERVICES

SAP S/4HANA, public cloud

A single OnePilot deployment governing several financial-data domains at once.

One platform to govern all data integrations and controls.

REPLACED

Replaced a manual solution.

CONTACT

Let's map your first feed.

We build the autonomous treasury one use case at a time, on the platform you already run.
