

# Market Data Monitor

Every rate you load, watched on arrival. **Bad values are caught before they reach SAP, and you only hear about the ones that need you.**

Your feeds, overnight

*The monitor*

Clean rates in SAP

# 06:00. The overnight rates load while the team sleeps.

## The load

Hundreds of rates and curves from providers, central banks and internal sources, loaded on the scheduler: per instrument group, timezone and daylight-saving aware.

**Bloomberg**

**LSEG**

**CME Group**

## This morning, two of them are wrong

### One FX rate spikes

A provider glitch shifts the decimal: 4.31 yesterday, 43.1 today. Ten times off, and headed for SAP.

### One curve arrives incomplete

The yield curve is missing three tenors. Everything downstream would quietly calculate around the hole.

# A bad rate does not announce itself.

Checking everything by hand does not scale. Checking nothing is how month-end gets scary.

# The hub watches every value. It asks when it needs you.

## Anomaly checks on arrival

Every value is checked as it lands: spikes against history, staleness, completeness, timeliness. Bad data stops here, not in SAP.

## Manage by exception

Flagged values wait in one queue for an approve or reject decision. The rest flows straight through.

## Alerts where you work

Email alerts and the Notifications Center out of the box. Your ticketing system can be wired in during implementation.

**100%**

of values checked

**1**

exception queue

**360°**

audit on every decision

## Six steps, from the feed to a value you can trust.

Runs on the scheduler, per instrument group, timezone and DST aware. Everything is logged.

# You see the exception. The rest just runs.

## STEP 04 · DECIDE

### The odd value, in context

The analyst opens the flagged value and sees the new value, the history it broke from and the source it came from, in one screen. Approve releases it. Reject stops it. Rejected values never reach SAP.

## STEP 05-06 · RELEASE & NOTIFY

### Clean data moves, people hear about it

Approved data distributes to SAP and every downstream system. The decision, the reason and the timing go on the audit trail, and the right people are notified automatically.

# The controls are built in, not bolted on.

## A full audit trail

Every value and every change is recorded, end to end.

## Segregation of duty

The changes that matter need a second person.

## Automatic checks

Odd or bad data is caught before it reaches a system.

## Alerts on exceptions

You hear about the odd one out; the rest just runs.

## No code to change it

Your rules, changed by your team, no IT project.

## ISO 27001 and SOC 1

The security controls your auditors already expect.

# The governance layer of Market Data Hub.

The monitor is how Market Data Hub, the flagship OnePilot app, keeps one governed source feeding every system: every value validated, checked for anomalies and logged.

**Bloomberg**

**LSEG**

**CME Group**

Watching the feeds you already rely on.

It runs on **OnePilot**, the same governed layer under Smart Trading and the AI co-workers. One way to connect to all of it:

SAP systems

Spreadsheets & files

Email

Web & APIs

AI

# Built to stay done.

Give us twenty minutes on where your market data comes from, and we will show the monitor catching a bad value before SAP ever sees it.
