

THE TREASURY WORKSPACE

TreasuryCentral

Where your people and AI agents run treasury together, on the systems you already have.

- ◆ The whole treasury day on one surface: orchestration, automation, monitoring and compliance.
- ◆ The treasury applications run inside it, alongside the use cases your own team builds.
- ◆ Every source, counterparty and enterprise system reached through one governed layer, on your SAP data.

IT'S ALL ONEPILOT · TREASURYCENTRAL IS THE WORKSPACE INSIDE IT

TreasuryCentral

THE TREASURY WORKSPACE

Where your people and AI agents run treasury together, the whole treasury day on one surface.

Orchestration · Automation · Monitoring · Compliance

Bricken OnePilot

EVERYTHING TREASURY DEALS WITH

Banks · Trading venues · Data providers · Central banks · Authorities

EVERYTHING THE BUSINESS RUNS ON

SAP · Other ERPs · Data lakes · Trading and OMS · Best-of-breed apps

THE PROBLEM

The treasurer's day on one surface

A treasurer's day goes into the gaps between systems: grey-scale processing through endless SAP GUIs, and data parsed by hand out of one system and into the next process step. Around those gaps sit brittle, hand-built feeds that break when a field changes or the person who built them leaves, with no audit trail, no owner and no monitoring.

TreasuryCentral closes the gaps. It is the treasury workspace where humans and agents collaborate, and its value is bringing the business context for treasury together in one place. Underneath it, OnePilot reaches every source, counterparty and enterprise system, so the context a decision needs is already in the room instead of three screens away.

WHAT THE WORKSPACE IS

HUMANS AND AGENTS

One surface, worked together

Cash, investments, debt and exposure roll up from every entity, reconciled to the statements already in SAP, so the group number is current instead of a Monday spreadsheet pull. Permissioned agents do the repetitive work underneath, ingesting, validating, posting and reconciling, and surface only what needs a decision. They work inside the context the backing systems provide, which is what makes the output worth acting on.

THE APPLICATIONS INSIDE IT

Treasury apps, and the ones you build

Market data governance, SmartTrading, liquidity, ESG, credit data, bank statements, bank fees and bank messaging each run as an app in the workspace, on the same governed layer. The slot that matters most is the empty one: your team builds its own use cases into solid apps here, on OnePilot, with the connectivity and the audit trail the delivered apps use.

YOUR WORKSTATION, REPLACED

Mail, Teams, calendar, documents

Treasury collaboration does not happen inside a treasury system. It happens across mail, chat, a calendar and a folder of attachments, and then gets re-keyed. Those sit in the workspace next to the treasury apps, so the conversation about a position and the position itself are finally in one place.

THE ARCHITECTURE

There is no outside

Describing OnePilot as connecting to outside systems is a technical view, and the wrong one for how treasury actually works. Every source, counterparty and enterprise system sits inside the governed layer, and the workspace is where you meet them. What goes away: grey-scale processing through endless SAP GUIs, and manual data parsing between systems and process steps.

Brisken OnePilot

one governed layer that brings every source into the workspace, visible, accessible, actionable

EXTERNAL SERVICES AND COUNTERPARTIES

Data providers · Trading venues · Banks · Central banks · Government offices · Credit and rating agencies · Exchanges ·
Custodians · Clearing houses · Payment networks · Authorities · Tariffs and customs

Brisken OnePilot — and every enterprise system too, one governed layer for data, process and control

ENTERPRISE SYSTEMS AND DATA

SAP on-prem, private cloud, public cloud · Other ERPs · Databases · Data lakes · BI and analytics · Trading and OMS ·
Risk systems · Import and export · Document management · APIs and connectors · Best-of-breed apps

GOVERNED BY DESIGN

One set of controls across the workspace and every app

Every value carries where it came from, who approved it and when, so an audit follows the trail without a reconstruction project. Limits and tolerances are set once; only the records that breach them surface for a person, and a second approver signs off before a payment or a deal is released. The workspace, the treasury apps and the ones you build yourself all run inside the same controls, on the SAP data you already trust, with no separate store to reconcile.

COMMON QUESTIONS

What is TreasuryCentral?

TreasuryCentral is the treasury workspace where humans and AI agents collaborate. It brings the business context for treasury together in one place, the whole day on one surface, and orchestrates, automates, monitors and controls the work that runs across it.

How does TreasuryCentral relate to OnePilot?

Technically all of it is OnePilot. TreasuryCentral is a treasury-centric use case of the platform, and the apps inside it are OnePilot applications wrapped into a treasury value proposition. OnePilot is not a layer the workspace sits on top of and calls out from; it is the environment everything runs inside, which is why a counterparty and an enterprise system are reached the same governed way.

Which applications run inside it?

Market data governance, SmartTrading, liquidity, ESG, credit data, bank statement generation, bank fees and bank messaging, plus the use cases your own team builds as apps on OnePilot.

Can our own team build use cases in it?

Yes, and it is the point. Customers build their own use cases into solid apps in the workspace, on OnePilot, using the same connectivity, governance and audit trail as the applications we deliver.

Does it need a separate data store?

No. It works on the SAP data you already trust, so there is no separate store to reconcile. Every move is logged, and every action stays inside your controls.

The SAP logo is a blue square with the word "SAP" in white, bold, sans-serif capital letters.
