

Bank Fee Portal

Check every bank charge against what you actually agreed, line by line.

- ◆ Loads every bank fee statement in any format: CAMT.086, TWIST BSB and proprietary.
- ◆ Matches each charge against your negotiated agreement and flags every variance.
- ◆ A line-level audit trail behind every fee, in one place, not scattered across statements.
- ◆ Sits in front of SAP's own bank-fee analysis, so every bank reaches the review.

Getting every bank's statement into the fee review

Bank fee statements arrive in three shapes: the older TWIST BSB format, the ISO 20022 CAMT.086 that is replacing it, and each bank's own proprietary layout. SAP added native bank-fee analysis in S/4HANA 1809, but it expects clean CAMT.086 in. The statements that arrive in any other format never reach the analyzer, so the fees on them never get reviewed.

Fee leakage is rarely a single dramatic overcharge; it is the slow drift between a contracted rate and what the bank actually applies, on exactly those statements nobody reviews. The Bank Fee Portal sits in front and accepts every format, normalizes it, and feeds the analysis, so the fee review covers every bank, not just the ones that happen to send clean files.

HOW IT WORKS

Every statement in, every variance flagged

The portal ingests the statements, enriches each fee line for cost analytics, and feeds SAP's analysis, so the comparison of charged against agreed can run on every account.

1

Load

Every bank statement and fee line, from every account, in any format: CAMT.086, TWIST BSB or proprietary.

2

Match

Each charge is compared against the fee you negotiated in the agreement.

3

Flag

Every variance is surfaced, with a line-level trail behind it.

HOW IT COMPARES

The portal versus the two usual paths

	Bank Fee Portal in front of SAP	SAP-native analysis alone	Manual / spreadsheet
Input formats accepted	TWIST BSB, CAMT.086, proprietary, normalized in	Clean CAMT.086	Whatever a person can open
Off-format statements	Parsed and delivered into the analysis	Stall outside the app	Re-keyed by hand, if at all
Overcharge detection	Every bank reaches the comparison	Only banks already on CAMT.086	Spot-checks, not line by line
Effort per cycle	Ingest is configured once, runs on its own	Manual conversion for off-format banks	Hours of clerical work each run
Audit trail	Logged ingest, exception alerts	Within the app for loaded data	None beyond the spreadsheet

The portal sits in front of SAP's own bank-fee analysis; it does not replace it. SAP's native analysis is capable once the data is in; the portal's job is getting every bank's statement, in any format, into it.

WHAT IT RECOVERS

What it **recovers**

- + Overcharges that would otherwise be paid without a second look
- + The audit trail behind every fee, in one place, not scattered across statements

WHAT IT DELIVERS

- ◆ Every fee line enriched for cost analytics and surfaced on a dashboard.
- ◆ Each charge matched against the negotiated agreement, with a line-level trail.
- ◆ Every variance flagged, so overcharges are seen before they are paid.
- ◆ One place for every account's fees, in every format, not scattered across statements.

WHY FORMAT MATTERS

Format coverage is overcharge coverage.

You cannot audit a fee statement you never managed to load. The bank that sends a proprietary file is the bank whose fees go unchecked, so getting that statement into the analysis is what makes the discrepancy visible. The portal sits in front and accepts every format, so no bank is left out of the review.

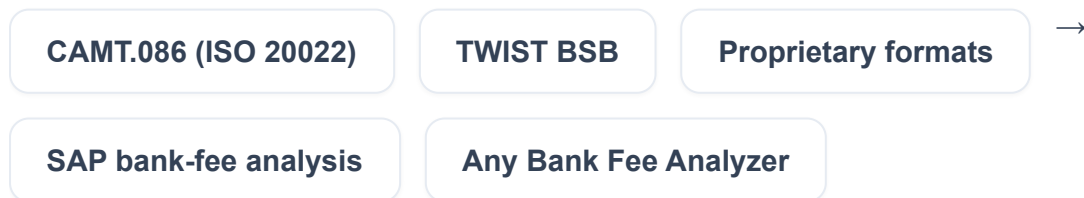

BUILT ON THE STANDARD

Where SAP's native analysis stops

CAMT.086 is the ISO 20022 bank-fee-statement format that replaces the older TWIST BSB. SAP added native bank-fee analysis in S/4HANA release 1809, delivered as a Fiori app that compares charged fees against expected ones, but it reads clean CAMT.086 only. Banks have not standardized on it; many still send TWIST BSB or a proprietary layout, and those are exactly the statements the portal exists to normalize and bring in.

WORKS WITH

Any statement format in, one analysis out

COMMON QUESTIONS

How do I automate CAMT.086 bank fee statement analysis in SAP?

CAMT.086 is the ISO 20022 bank-fee-statement format that replaces TWIST BSB. SAP added native bank-fee analysis in S/4HANA 1809 via a Fiori app, but it expects clean CAMT.086 in; banks still send proprietary and TWIST formats. A bank-fee portal ingests any format, enriches for analytics, and distributes to the analyzer, so the fee review is not gated on format.

How do I detect bank overcharges or fee leakage with SAP treasury?

Bank fee statements are rarely audited line by line, so contracted rates and applied charges drift apart unnoticed. Loading the statements as structured data lets the system compare charged against expected fees and flag discrepancies. The portal's job is getting every statement, in any format, into that analysis so the comparison can run at all.

How do I process TWIST BSB or proprietary bank fee statements into SAP?

Banks issue fee statements in TWIST BSB, the older industry format, in CAMT.086, and in their own proprietary layouts. SAP's native analysis expects CAMT.086, so the off-format statements stall. A format-agnostic portal parses TWIST BSB and proprietary files, normalizes them to the structure SAP's analyzer reads, and delivers them in, so no bank is left out of the review.
