

Market Data Hub

Every rate, curve and price through one managed feed. No hand-keyed uploads.

- ◆ Bloomberg, Refinitiv (LSEG), ICE, CME, 360T, OANDA and central banks through one governed feed.
- ◆ Ingested once, normalized, then distributed to SAP and non-SAP, both directions, no code.
- ◆ Adding or switching a provider is a configuration change, not a new interface to build.
- ◆ One point of control for entitlements, usage, and the audit trail behind every rate.

EVERY PROVIDER · ONE FEED

Bloomberg

LSEG

Ice

CME Group

one governed feed

SAP

non-SAP

Both directions, no code. Central banks included.

THE PROBLEM

Market data into SAP, without the scripts that break

Getting market data into SAP usually means a Datafeed RFC connection or a custom per-vendor script: one for Bloomberg, another for Refinitiv, another for 360T. Both need ABAP to set up and maintain, and both break the moment a provider changes a field. Rates, curves and prices for SAP TRM and Market Rates Management end up hand-keyed, or held together by scripts nobody owns, and the day a feed breaks is the day the close waits on it.

The Market Data Hub replaces that with one managed feed. It ingests every provider once, normalizes the data, and distributes the same governed number into SAP TRM and Market Rates Management, with a full audit trail and exception alerts, no code and no per-vendor interface to keep alive.

THE MARKET

Loading market data by hand is the default, not the exception

71%

of US SAP-treasury roles describe building or hand-running integrations into SAP, or manual data work (29 of 41).

34%

are tied to an active S/4HANA migration or SAP implementation, the moment feeds get re-plumbed (14 of 41).

22%

name a specific market-data or trading vendor whose feed has to reach SAP, and that is a floor (9 of 41).

Source: Brisken Shadow Integration Report, N=41 US SAP-treasury job ads, read 2026-06-17. These are market-research figures, not a Market Data Hub performance metric.

HOW IT WORKS

One managed feed, from source to system

The hub sits between every provider and every system that needs a rate. Ingest once, govern in one place, distribute everywhere, so the same governed figure reaches each consumer instead of arriving three different ways.

1

Ingest

Every provider's rates, curves and prices arrive in their own formats: Bloomberg, Refinitiv, ICE, CME, 360T, OANDA, central banks and government agencies.

2

Govern

One managed feed validates and normalizes each source, and controls entitlements and usage in a single place, with the audit trail attached.

3

Distribute

The same number flows to SAP TRM, Market Rates Management and non-SAP targets, both directions, straight through, no ABAP.

GOVERNED BY THE FEED

Control lives in the feed, not in each interface

Governance lives in the feed, not in each interface. Every source is validated and normalized on the way in, entitlements and usage are controlled from one place, and manage-by-exception alerts surface anything that looks wrong before it reaches a decision. Segregation of duties and a full audit trail sit on the feed itself, so control does not depend on whoever wrote the last script.

HOW IT COMPARES

The hub versus the two usual paths

	Market Data Hub	SAP-native Datafeed	Custom script
Setup	No-code configuration	ABAP function lists and translation tables	Bespoke code per provider
Add or swap a provider	Configuration change	New function list and mapping	New script
Multiple providers	One normalized pipe, many sources	Configured per provider	One interface per provider
Governance	Audit trail, segregation of duties, exception alerts built in	Manual or custom	None unless coded
Maintenance owner	Vendor-managed (SaaS)	In-house ABAP	Whoever wrote it
When a provider changes a field	Absorbed in configuration	ABAP edit needed	The script breaks
SAP-listed	Yes, on the SAP Store	Native to SAP	Not applicable

Honest comparison. The SAP-native Datafeed is a real, supported path; the point of a hub is the no-code, multi-provider, governed layer over it, not a claim that SAP cannot do this.

WHAT IT RETIRES

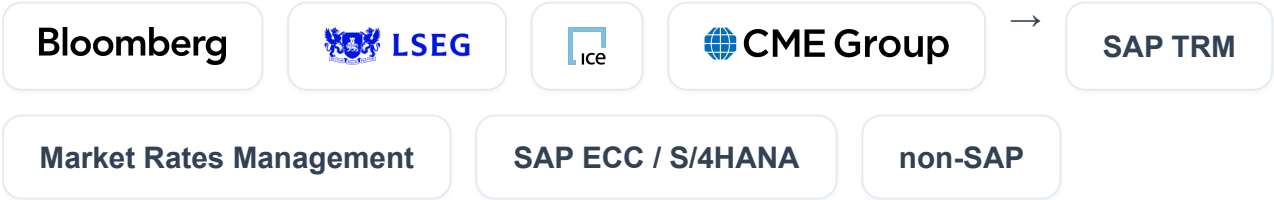

What it retires

- ✗ Per-provider upload scripts, maintained by hand and understood by one person
- ✗ Rates re-keyed into spreadsheets before they ever reach SAP
- ✗ Point-to-point integrations that break when a feed changes a field
- ✗ ABAP upkeep for every new or changed provider

WORKS WITH

Every provider in, SAP and non-SAP out

Beyond the four shown above, the hub also handles Refinitiv (LSEG), 360T, OANDA, central banks and government agencies. Switching or adding a provider is a configuration change, not a new interface, so there is no per-vendor rebuild to maintain.

COMMON QUESTIONS

How do I get Bloomberg market data into SAP TRM automatically?

The SAP-native path is a Datafeed RFC connection with per-provider function lists and translation tables, or a per-security custom interface, both of which need ABAP upkeep and break when Bloomberg changes a field. A governed market-data hub ingests Bloomberg once, normalizes it, and distributes into SAP TRM with an audit trail and exception alerts, no code.

How do I load Refinitiv (LSEG) rates and curves into SAP S/4HANA treasury?

Refinitiv (LSEG) rates and curves reach SAP S/4HANA treasury through the same governed hub that handles any provider: ingest the feed once, normalize it, distribute into Market Rates Management. Switching or adding a provider is a configuration change, not a new interface, so there is no per-vendor rebuild to maintain.

Can I automate FX rates and yield curves into SAP Market Rates Management without ABAP?

Yes. SAP's native route uses a Datafeed RFC with function lists and translation tables, which needs ABAP to set up and maintain. A no-code market-data hub maps and schedules FX rates and yield curves into SAP Market Rates Management through configuration, so the treasury team owns the feed without writing or changing ABAP.

What is the alternative to a custom Bloomberg-to-SAP script that keeps breaking?

A custom script breaks whenever the provider changes a field or the person who wrote it leaves. A managed market-data hub replaces it with a configured, monitored interface: provider changes are absorbed in configuration, the feed is governed with an audit trail and exception alerts, and nobody is babysitting a brittle script.

How do I feed OANDA or central-bank rates into SAP cash management?

OANDA and central-bank rates feed into SAP cash management through the same hub as every other source. Multiple providers land in one normalized pipeline rather than separate point interfaces, so the rates that drive cash and liquidity views come from one governed feed with a single point of control.

How do I govern multiple market-data providers into SAP from one place?

A market-data hub is the single point of control for every provider feeding SAP: Bloomberg, Refinitiv, OANDA, 360T, central banks. It validates, normalizes and distributes each feed, with an audit trail, segregation of duties, and manage-by-exception alerts. Governance is built into the feed, not bolted on per interface afterwards.

What is the best way to handle market-data integration during an S/4HANA migration?

A migration forces every treasury data feed to be re-plumbed, which is when hand-built market-data interfaces are most expensive to rebuild. Moving the feeds onto a governed hub during the migration re-platforms them once onto a managed interface instead of re-coding each script. In a read of US SAP-treasury job ads, 34% sat inside an active migration.

Is there a no-code alternative to SAP TRM datafeed configuration?

The SAP TRM Datafeed needs ABAP-side setup of function lists and translation tables per provider. The alternative is a no-code hub that handles ingest, mapping and distribution through configuration, aimed at treasury teams that do not have the ABAP capacity to build and maintain the datafeed themselves.

PROOF

The Market Data Hub is the flagship product, with its own overview deck, and is listed on the SAP Store. Brisken is an SAP Co-Innovation Partner, certified to ISO 27001 and SOC 1 Type II, and delivers the hub as a managed product on your SAP landscape, with data partners including Bloomberg, Refinitiv, CME Group, 360T, Deutsche Boerse and OANDA.
